

ABSTRACT OF THE DISCLOSURE

A system and a method store, display and report outgoing call log data associated with telephone calls from a subscriber's telephone. The system includes a switch in one network that receives a telephone call from the subscriber's telephone and launches a query in response to an AIN trigger to a service control point. In response, the service control point forwards associated call data to an interface server in another network via a generic data interface. The interface server obtains additional information from a directory database and sends the call data and the additional information to an outgoing call log database, which stores the call data and the additional information as the outgoing call log data. A web server retrieves the outgoing call log data and displays it to the subscriber at a web client.
